Week 4 Assignment

Visualizing relationships

Render this file to PDF and submit both the `.qmd` and the rendered `.pdf`, along with your Data Safari submission, via Canvas before Week 5's lecture (Monday). See the syllabus for the late policy.

Note: This week also includes your first Data Safari exercise — a separate, short assignment. Both are due at the same time.

Using the built-in `trees` dataset (`data(trees)`):

1. Make a scatterplot of `Volume` vs. `Girth`, with a linear trend line added.
2. Make a second scatterplot of `Volume` vs. `Height`.

Which of the two predictors looks more strongly related to `Volume`, just from the plots?

3. `trees` has no grouping variable, so faceting isn't useful here — instead, using the built-in `iris` dataset, make a faceted scatterplot of `Petal.Length` vs. `Petal.Width`, one panel per `Species`.

Does the relationship look similar across species, or different?

4. In 2–3 sentences: pick one plot from this course so far (any week) that you think could be improved, and describe what you'd change (labels, color palette, plot type) and why.
