Data Safari #2

Week 7 · Replicating a published figure

Same format as Data Safari #1 — find a paper, recreate a figure from its public data, and reflect on the process. Render this file to PDF and submit both the `.qmd` and the rendered `.pdf` via Canvas alongside this week's regular assignment, before Week 9's lecture (Monday, following Spring Break). See the syllabus for the late policy.

Tip: now that you know t-tests and ANOVA, a good figure to look for this time is a **group comparison plot** — a boxplot or bar chart with error bars showing means across 3 or more groups, ideally one with significance annotations you could try to reproduce statistically as well as visually.

Instructions

1. **Find a paper** with a figure comparing groups, and publicly available data behind it.

Full citation:

2. **Recreate the figure**, working from the actual data file.
3. **Reflect**: how easy was the data to find and use? How closely does your figure match? What would you change about the paper's data documentation?

Bonus (optional)

If the figure shows a significant group difference, try running the appropriate test yourself (t-test or ANOVA) on the data and see whether your result matches what's reported in the paper's text.
