# Week 3 Assignment

## Exploring distributions

Render this file to PDF and submit both the `.qmd` and the rendered `.pdf` via Canvas before Week 4's lecture (Monday). See the syllabus for the late policy.

Using the built-in `chickwts` dataset (`data(chickwts)`) — note this is a different dataset from `ChickWeight`.

1. Make a histogram of `weight`, choosing a bin width you think shows the shape well.

Explain your bin-width choice in one sentence.

2. Make a boxplot of `weight` by `feed`.
3. For each `feed` group, compute the mean, standard deviation, and the mean–median gap (as in this week's tutorial).

Which group(s) look most skewed?

4. Based on what you see, would you be comfortable assuming roughly equal variance across all `feed` groups? Why or why not? (There's no need to run a formal test yet — just describe what the plots and numbers suggest.)
